

FiberCor Replacement Instructions

When handling the FiberCor material, it is important to always wear proper personal protective equipment:

- Safety Glasses
- Protective Gloves
- Dust Mask

Before beginning the repair, it is important to determine the amount of material required:

Larger Repairs	Smaller Repairs
<p>For larger repairs, cut along the FiberCor block as shown. The material will start to expand, and the entire block will become loose. You can use the box provided with the kit to contain the material. The entire kit will cover approximately 4 cubic feet.</p> 	<p>If you need to remove smaller amounts of material, simply cut a small section or hole on the top of the block. Then remove the amount you intend to use and put the rest of the material back in the box provided with the kit.</p> 

Once you have the quantity you need, just loosen the material in your hand and fill in the void. You can compact the material to give it a good fit, and you are finished.

For more details regarding the FiberCor replacement kit, please refer to your diagnostic software program and the 'FiberCor Service Video' located in the video section of the program.
